

Download Mac Force Eject Disk Boot Up

There's a rare case where you can end up with a disk stuck in your Mac and not be able to access the boot manager. This can occur in a Mac that either has no startup drive or has a brand-new startup drive that hasn't been formatted yet. In the newest versions of the boot manager (Intel only, I believe), it is possible to simply Option-Boot the computer and press the Eject key on the keyboard to eject a disc. At some point, there's a chance that a CD, DVD or Blu-Ray disc is going to get stuck in your Mac or external optical drive. Fortunately, there are some simple steps that can be taken to force eject a disc that's stuck.
